1 Introduction

1.1 Overview

This document describes BATS Binary Order Entry (BOE), the BATS proprietary order entry protocol. Where applicable, the terminology (e.g., time in force) used in this document is similar to that used by the FIX protocol to allow those familiar with FIX to more easily understand BOE. This document assumes the reader has basic knowledge of the FIX protocol.

BOE fulfills the following requirements:

- *CPU and memory efficiency.* Message encoding, decoding, and parsing are simpler to code and can be optimized to use less CPU and memory at runtime.
- Application level simplicity. State transitions are simple and unambiguous. They are easy to apply to a Member's representation of an order.
- Session level simplicity. The session level protocol (login, sequencing, replay of missed messages, logout) is simple to understand.

While BATS has strived to preserve feature parity between FIX and BOE where possible, certain BOE functionality will not be made available in FIX.

All binary values are in little Endian (used by Intel x86 processors), and not network byte order.

Each message is identified by a unique message type. Not all message types are used in all of BATS' trading environments globally. A complete listing of all message types is provided in the **List of Message Types** section

All communication is via standard TCP/IP.

1.2 Data Types

The following data types are used by BOE. The size of some data types varies by message. All data types have default values of binary zero, in both Member to BATS and BATS to Member contexts.

- Binary: Little Endian byte order, unsigned binary value. The number of bytes used depends on the context.
 - One byte: FE = 254
 - o Four bytes: 64 00 00 00 = 100
- Signed Binary: Little Endian byte order, signed two's complement, binary value. The number of bytes used depends on the context.
 - \circ One byte: DF = -33
 - o Four bytes: 64 00 00 00 = +100
- Binary Price: Little Endian byte order value, eight bytes in size, with four implied decimal places. So, if the value is 123,400, the actual value taking into account implied decimal places is 12.34.
 - o 08 E2 01 00 00 00 00 00 = 123,400/10000 = 12.34

- Signed Binary Price: Little Endian byte order value, signed two's complement, eight bytes in size, with four implied decimal places. So, if the value is -123,400, the actual value taking into account implied decimal places is -12.34.
 - o 08 E2 01 00 00 00 00 00 = 123.400/10000 = 12.34
 - F8 1D FE FF FF FF FF FF = 123.400/10000 = -12.34
- Short Binary Price: Little Endian byte order value, four bytes in size, with four implied decimal places. So, if the value is 12,300, the actual value taking into account implied decimal places is 1.23.
 - o 0C 30 00 00 = 12,300/10000 = 1.23
- Signed Binary Fee: Little Endian byte order value, eight bytes in size, signed, with five implied decimal places. So, the value -123,000 is -1.23 after taking account for the five implied decimal places.
 - o 88 1F FE FF FF FF FF FF = -123,000/100000 = -1.23
- Alpha: Uppercase letters (A-Z) and lowercase letters (a-z) only. ASCII NUL (0x00) filled on the right, if necessary. The number of bytes used depends on the context.
- Alphanumeric: Uppercase letters (A-Z), lowercase letters (a-z) and numbers (0-9) only. ASCII NUL (0x00) filled on the right, if necessary.
- Text: Printable ASCII characters only. ASCII NUL (0x00) filled on the right, if necessary.
- DateTime: 8 bytes. The date and time, in UTC, represented as nanoseconds past the UNIX epoch (00:00:00 UTC on 1 January 1970). The nanoseconds portion is currently ignored and treated as 0 (i.e. the times are only accurate to microseconds) on input, and will always be set to 0 by BATS in outgoing messages. However, BATS may begin populating the nanoseconds portion at any time without warning.

For example: 1,294,909,373,757,324,000 = 2011-01-13 09:02:53.757324 UTC.

1.3 Optional Fields and Bitfields

Some messages such as New Order and Modify Order have a number of optional fields. A required field in the message specifies the optional fields that are present at the end of the message. If a bit is set, the field will be present. Fields are appended to the end of the message. There is no implicit framing between the optional fields. In order to decode the optional fields, they *must* be appended in a particular order to the end of the message. The fields of the first bitfield are appended first, lowest order bit first. Next, the fields of the next bitfield are appended, lowest order bit first. This continues for all bitfields. While certain *RESERVED* bits within a defined bitfield are used within another BATS market and will be ignored, bits that are reserved for future expansion must be set to '0' when noted in the bitfield description.

The size and data type for each optional field is described in the **List of Optional Fields** section.

Incoming messages (New Order, Modify Order, Cancel Order) will be rejected if they have any bits set that are not documented in the *NewOrderBitfields*, *ModifyOrderBitfields*, or *CancelOrderBitfields* defined further below.

Note that the set of optional fields returned for each BATS to Member message type is determined at session login (using the Login Request message); hence, the exact size and layout of each message received by the client application can be known in advance. Any requested optional field which is irrelevant in a particular context will still be present in the returned message, but with all bytes set to binary zero (0x00).

Each return message from BATS to a Member indicates the optional fields which are present, even though the Member firm indicated during login which optional fields are to be sent. These fields are included (and duplicated) by design so that each message can be interpreted on its own, without having to find the corresponding login request or response to know which optional fields are present. So, for example, in a log file, decoding a message requires only that single message.

Example messages are shown with each message type which should help to make this concept clear.

2 Session

2.1 Message Headers

Each message has a ten byte header. The two initial *StartOfMessage* bytes are present to aid in message reassembly for network capture purposes. The *MatchingUnit* field is only populated on non-session level messages sent from BATS to the Member. Messages from Member to BATS and all session level messages must always set this value to 0.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	Message type.
MatchingUnit	5	1	Binary	The matching unit which created this message. Matching units in BOE correspond to matching units on Multicast PITCH. For session level traffic, the unit is set to 0.
				For messages from Member to BATS, the unit must be 0.
SequenceNumber	6	4	Binary	The sequence number for this message. Messages from BATS to Member are sequenced distinctly per matching unit. Messages from Member to BATS are sequenced across all matching units with a single sequence stream.
				Members can optionally send a 0 sequence number on all messages from Member to BATS; however, BATS highly recommends members to send sequence numbers on all inbound messages.

2.2 Login, Replay and Sequencing

Session level messages, both inbound (Member to BATS) and outbound (BATS to Member) are unsequenced.

Inbound (Member to BATS) application messages are sequenced. Upon reconnection, BATS informs the Member of the last processed sequence number; the Member *may* choose to resend any messages with sequence numbers greater than this value. A gap forward in the Member's incoming sequence number is permitted at any time and is ignored by BATS. Gaps backward in sequence number (including the same sequence number used twice) are never permitted and will always result in a Logout message being sent and the connection being dropped.

Outbound (BATS to Member) application messages (but *not* Order Rejected, Cancel Rejected or User Modify Rejected) are monotonically sequenced per matching unit. While matching units on BOE correspond directly to matching units on Multicast PITCH, sequence numbers do not.

Upon reconnection, a Member sends the last received sequence number per matching unit in a Login Request message. BATS will respond with any missed messages. However, when the Login Request SpecifiedOnlyUnitReplay flag is enabled, BATS will exclude messages from unspecified matching units during replay. BATS will send a Replay Complete message when replay is finished. If there are no messages to replay, a Replay Complete message will be sent immediately after a Login Response message. BATS will reject all orders during replay.

Assuming Member has requested replay messages using a properly formatted Login Request after a disconnect, any unacknowledged orders remaining with the Member after the Replay Complete message is received should be assumed to be unknown to BATS.

Unsequenced messages will not be included during replay.

A session is identified by the username and session sub-identifier (both supplied by BATS). Only one concurrent connection per username and session sub-identifier is permitted.

If a login is rejected, an appropriate Login Response message will be sent and the connection will be terminated.

2.3 Sequence Reset

A reset sequence operation is not available for Binary Order Entry. However, a Member can send a Login Request message with SpecifiedOnlyUnitReplay field enabled, and NumberOfUnits field set to zero. Then, upon receiving a Login Response message from BATS, the Member can use the field LastReceivedSequenceNumber as the sequence starting point for sending future messages.

2.4 Heartbeats

Client Heartbeat messages are sent from Member to BATS and Server Heartbeat messages are sent from BATS to Member if no other data has been sent in that direction for one second. Like other session level messages, heartbeats from BATS to the Member do *not* increment the sequence number. The sequence number for heartbeat messages will be 0. If BATS receives no inbound data or heartbeats for five seconds, a Logout message will be sent and the connection will be terminated. Members are encouraged to have a one second heartbeat interval and to perform similar connection staleness logic.

2.5 Logging Out

To gracefully log out of a session, a Logout Request message should be sent by the Member. BATS will finish sending any queued data for that port and will then respond with its own Logout message and close the connection. After receipt of a Logout Request message, BATS will ignore all other inbound (Member to BATS) messages except for Client Heartbeat.

3 Session Messages

3.1 Member to BATS

3.1.1 Login Request

A Login Request message must be sent as the first message upon connection. In addition to ensuring the client may connect, the client must include the last consumed sequence number per matching unit. BATS uses these sequence numbers to determine what outbound traffic, if any, was missed by the Member.

The client does *not* need to include a sequence number for a unit if they have never received messages from it. For example, if the client has received responses from units 1, 3, and 4, the Login Request message need not include unit 2. If the client wishes to send a value for unit 2 anyway, 0 would be the only allowed value.

The *Return Bit* fields control which attributes of a message will be returned by BATS for the remainder of the session. This allows Members to tailor the echoed results to the needs of their system without paying for bandwidth or processing they do not need. Refer to the **List of Return Bitfields** section for additional information. BATS will verify received *Return Bitfields* at login time; see the **Login Response** section for more information.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x01
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.
SessionSubID	10	4	Alphanumeric	Session Sub ID supplied by BATS.
Username	14	4	Alphanumeric	Username supplied by BATS.
Password	18	10	Alphanumeric	Password supplied by BATS.
NoUnspecified UnitReplay	28	1	Binary	Flag indicating whether to replay missed outgoing (BATS to Member) messages for unspecified units. $0x00 = False (Replay Unspecified Units)$ $0x01 = True (Suppress Unspecified Units Replay)$

Order Acknowledgement Bitfields	29	7	Binary	Bitfields indicating message fields to be returned on Order Acknowledgement messages. See the List of Return Bitfields section.

NumberOfUnits	03	Three unit/sequence pairs to follow.

UnitNumber₁ 01 Unit 1

UnitSequence₁ 4A BB 01 00 Last received sequence of 113,482

UnitNumber₂ 02 Unit 2

UnitSequence₂ 00 00 00 00 Last received sequence of 0

UnitNumber₃ 03 Unit 3

UnitSequence₃ 79 A1 00 00 Last received sequence of 41,337

3.1.2 Logout Request

To end the session, the Member should send a Logout Request message. BATS will finish sending any queued data and finally respond with a Logout message and close the connection.

A Member may simply close the connection without logging out, but may lose any queued messages by doing so.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x02
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.

Example Login Request Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	08 00	8 bytes
MessageType	02	Logout Request
MatchingUnit	00	Always 0 for inbound messages
SequenceNumbe	r 00 00 00 00	Always 0 for session level messages

3.1.3 Client Heartbeat

See the **Heartbeats** section for more information on heartbeats and the session level protocol.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x03
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.

Example Client Heartbeat Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	08 00	8 bytes
MessageType	03	Client Heartbeat
MatchingUnit	00	Always 0 for inbound messages
SequenceNumber	00 00 00 00	Always 0 for session level messages

3.2 BATS to Member

3.2.1 Login Response

A Login Response message is sent in response to a Login Request message. On a successful login, the *LoginResponseStatus* will be set to 'A'. On a failed login, *LoginResponseStatus* will be set to a value other than 'A', and *LoginResponseText* will be set to an appropriate failure description.

BATS will verify *Return Bitfields* at login time. If *Return Bitfields* are invalid, *LoginResponseStatus* will be set to 'F', and *LoginResponseText* will include a description of which byte and bit are invalid. This is done to ensure that reserved fields are not used, and only options that apply to the local market are set. See the **List of Return Bitfields** section for additional information.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x07
MatchingUnit	5	1	Binary	Always 0 for session level messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.
LoginResponse Status	10	1	Alphanumeric	Accepted, or the reason for the rejection. A = Login Accepted B = Session in use D = Session is disabled F = Invalid Return Bitfield in login message I = Invalid unit given in Login message M = Invalid Login Request message structure N = Not authorized (invalid username/password) Q = Sequence ahead in Login message S = Invalid session
LoginResponse Text	11	60	Text	Human-readable text with additional information about the reason for rejection. For successful logins, this is empty. ASCII NUL (0x00) filled on the right, if necessary.
NoUnspecified UnitReplay	71	1	Binary	Echoed from the Login Request.

UnitSequence₄ 79 A1 00 00 Last received sequence of 41,337

3.2.2 Logout

A Logout is usually sent in response to a Logout Request. Any queued data is transmitted, a Logout is sent, and BATS will close the connection. However, a Logout may also be sent if the Member violates the protocol specification (e.g., by moving backwards in sequence number).

The Logout contains the last transmitted sequence number for each unit, allowing the Member to check that their last received sequence number matches.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this
				field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x08
MatchingUnit	5	1	Binary	Always 0 for session level messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.
LogoutReason	10	1	Alphanumeric	The reason why the Logout message was sent.
				U = User Requested
				E = End of Day
				A = Administrative
				! = Protocol Violation
LogoutReason	11	60	Text	Human-readable text with additional
Text				information about the reason for logout.
				Particularly useful if LogoutReason = !
				(Protocol Violation).
LastReceived	71	4	Binary	Last inbound (Member to BATS) message

SequenceNumber				sequence number processed by BATS.
NumberOfUnits	75	1		A number, n (possibly 0), of unit/sequence pairs to follow, one per unit from which the client has received messages.
UnitNumber ₁		1	Binary	A unit number.
UnitSequence ₁		4	Binary	Highest available sequence number for the unit.
•			Binary	
•				
•				
UnitNumber _n		1	Binary	A unit number.
UnitSequence _n		4	Binary	Highest available sequence number for the unit.

Example Logout Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	59 00	89 bytes
MessageType	08	Logout
MatchingUnit	00	Always 0 for session level messages
SequenceNumber	00 00 00 00	Always 0 for session level messages
LogoutReason	55	U = User Requested
LogoutReason	55 73 65 72 00 00 00 00 00 00	User

	00 00 00 00 00 00 00 00 00 00	
	00 00 00 00 00 00 00 00 00 00	
LastReceived	3F 93 01 00	103231
SequenceNumber		
NumberOfUnits	03	Three unit/sequence pairs to follow.
UnitNumber ₁	01	Unit 1
UnitSequence₁	4A BB 01 00	Last sent sequence of 113,482
UnitNumber ₂	02	Unit 2
UnitSequence ₂	00 00 00 00	Last sent sequence of 0
UnitNumber ₃	03	Unit 3
UnitSequence ₃	79 A1 00 00	Last sent sequence of 41,337

3.2.3 Server Heartbeat

See the **Heartbeats** section for more information on heartbeats and the session level protocol.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x09
MatchingUnit	5	1	Binary	Always 0 for session level messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.

Example Server Heartbeat Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	08 00	8 bytes
MessageType	09	Server Heartbeat
MatchingUnit	00	Always 0 for session level messages
SequenceNumber	00 00 00 00	Always 0 for session level messages

3.2.4 Replay Complete

See the **Login, Replay and Sequencing** section for more information on Login, sequencing and replay.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x13
MatchingUnit	5	1	Binary	Always 0 for session level messages.
SequenceNumber	6	4	Binary	Always 0 for session level messages.

Example Replay Complete Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	08 00	8 bytes
MessageType	13	Replay Complete
MatchingUnit	00	Always 0 for session level messages
SequenceNumbe	r 00 00 00 00	Always 0 for session level messages

4 Application Messages

4.1 Member to BATS

4.1.1 New Order

A New Order message consists of a number of required fields followed by a number of optional fields. The optional fields used are specified by setting bits in the *NewOrderBitfields*. Fields must be appended at the end of the message.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the
				StartOfMessage field.
MessageType	4	1	Binary	0x04
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.
SequenceNumber	6	4	Binary	The sequence number for this message
ClOrdID	10	20	Text	Corresponds to <i>ClOrdID</i> (11) in BATS FIX.
				Day-unique ID chosen by the client. Characters in the ASCII range 33-126 are allowed, except
				for comma, semicolon, and pipe.
				If the <i>ClOrdID</i> matches a live order, the order will be rejected as duplicate.
				Note: BATS only enforces uniqueness of ClOrdID values among currently live orders.
				However, we <i>strongly</i> recommend that you keep your ClOrdID values day-unique.
Side	30	1	Alphanumeric	Corresponds to Side (54) in BATS FIX.
				1 = Buy 2 = Sell
				5 = Sell Short (client affirms ability to borrow) 6 = Sell Short Exempt
OrderQty	31	4	Binary	Corresponds to <i>OrderQty</i> (38) in BATS FIX.
				Number of shares for the order. System-wide limit is 999,999 shares.

Optional fields						

Required Order Attributes:

The following are required to be sent on new orders for instruments traded on BATS:

- some form of symbology (see **Symbology** below).
- a *Price* only (limit orders) or a *Price* and/or *OrdType* (limit, market, or peg orders).
- Capacity.

All other values have defaults. See the table in the **List of Optional Fields** section for additional information about each optional field, including its default value.

Symbology:

For BATS US Equities symbology, please refer to the <u>BATS Symbology Reference</u> document.

Example New Order Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	4C 00	76 bytes
MessageType	04	New Order
MatchingUnit	00	Always 0 for inbound messages
SequenceNumber	64 00 00 00	Sequence Number 100
ClOrdID	41 42 43 31 32 33 00 00 00 00	ABC123
	00 00 00 00 00 00 00 00 00 00	
Side	31	Buy
OrderQty	E8 03 00 00	1000 shares
NewOrderBitfield1	04	Price
NewOrderBitfield2	2 C1	Symbol, Capacity, RoutingInst
NewOrderBitfield3	3 01	Account
NewOrderBitfield4	100	No optional fields
NewOrderBitfield5	5 00	No optional fields
NewOrderBitfield6	3 00	No optional fields
Price	5C 13 04 00 00 00 00 00	26.71
Symbol	4D 53 46 54 00 00 00 00	MSFT
Capacity	50	P = Principal
RoutingInst	52 00 00 00	R = Routable
Account	44 45 46 47 00 00 00 00 00 00	DEFG

00 00 00 00 00 00

4.1.2 Cancel Order

Request to cancel an order using the CIOrdID from a previous order.

Field	Offset	Length	Data Type	Description	
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.	
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.	
MessageType	4	1	Binary	0x05	
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.	
SequenceNumber	6	4	Binary	The sequence number for this message	
OrigClOrdID	10	20	Text	Corresponds to <i>OrigClOrdID</i> (41) in BATS FIX. ClOrdID of the order to cancel.	
CancelOrder Bitfield1	30	1	Binary	Bitfield indicating cancel fields to follow. Logical OR to include multiple fields. Value Name 1 ClearingFirm 2 RESERVED 4 RESERVED 8 RESERVED ClearingFirm is required for Service Bureau ports. Bits 5-8 must be set to 0. They are reserved for future expansion.	
CancelOrder Bitfield2	31	1	Binary	All bits <i>must</i> be set to 0. This field is reserved for future expansion.	
Optional fields					

Example Cancel Order Message: Field Name Heyadecimal

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	26 00	38 bytes
MessageType	05	Cancel Order
MatchingUnit	00	Always 0 for inbound messages
SequenceNumber	64 00 00 00	Sequence Number 100
OrigClOrdID	41 42 43 31 32 33 00 00 00 00	ABC123
	00 00 00 00 00 00 00 00 00 00	
CancelOrder	01	ClearingFirm
Bitfield1		
CancelOrder	00	(empty)
Bitfield2		
ClearingFirm	54 45 53 54	TEST

4.1.3 Modify Order

Request to modify an order. The order attributes to be modified are specified using *ModifyOrderBitfieldOne* and *ModifyOrderBitfieldTwo*.

Only *Price, Side, OrderQty, and OrdType* may be adjusted. Any change in *Price* or any increase in *OrderQty* will result in the order losing its time priority. *OrdType* may be adjusted from Limit to Market (but not from Limit to Peg or Peg to Limit). *Side* may only be used to change an order from a short sell to a long sell or vice versa. Modification of *Side* will only result in loss of priority if *Side* is changing to/from a short sell **AND** the *Symbol* is in a Regulation SHO Short Sale Circuit Breaker.

Other fields (including ExecInst) **will be ignored**, and the value from the original order will be re-used. In particular note that when a Day-ISO is modified the ISO designation is applied to the new order.

Changes in *OrderQty* result in an adjustment of the current order's *OrderQty*. The new *OrderQty* does not directly replace the current order's *LeavesQty*. Rather a delta is computed from the current *OrderQty* and the replacement *OrderQty*. This delta is then applied to the current *LeavesQty*. If the resulting *LeavesQty* is less than or equal to zero, the order is cancelled. This results in safer behavior when the replace request overlaps partial fills for the current order, leaving the Member in total control of the share exposure of the order.

MaxFloor and *DiscretionAmount* are preserved from the original order and applied to the new size and price.

A Modify Order should not be issued until the Order Modified message for the previous Modify Order has been received for that order. The BOE handler will reject a new Modify Order if it has not seen the prior Modify Order from the Matching Engine.

Modify Order requests that merely reduce *OrderQty* may be overlapped if the existing *ClOrdID* is re-used. This is the only case where re-use of the existing *ClOrdID* is allowed.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x06
MatchingUnit	5	1	Binary	Always 0 for inbound (Member to BATS) messages.
SequenceNumber	6	4	Binary	The sequence number for this message
ClOrdID	10	20	Text	New ClOrdID for this order.

OrigClOrdID	30	20	Text	Corresponds to <i>OrigClOrdID</i> (41) in BATS FIX. ClOrdID of the order to replace. In the case of multiple changes to a single order, this will be the <i>ClOrdID</i> of the most recently accepted change.
ModifyOrder Bitfield1	50	1	Binary	Bitfield indicating order modify fields to follow. Logical OR to include multiple fields. Value
ModifyOrder	51	1	Binary	All bits <i>must</i> be set to 0. This field is reserved
Bitfield2				for future expansion.
Optional fields				

Example Modify Order Message:

Field Name	Hexadecimal	Notes
StartOfMessage	BA BA	Start of message bytes.
MessageLength	3E 00	62 bytes
MessageType	06	Modify Order
MatchingUnit	00	Always 0 for inbound messages
SequenceNumber	r 64 00 00 00	Sequence Number 100
ClOrdID	41 42 43 31 32 34 00 00 00 00	ABC124
	00 00 00 00 00 00 00 00 00	
OrigClOrdID	41 42 43 31 32 33 00 00 00 00	ABC123
	00 00 00 00 00 00 00 00 00	
ModifyOrder	0C	OrderQty, Price
Bitfield1		
ModifyOrder	00	(empty)
Bitfield2		
OrderQty	E0 2E 00 00	12,000 shares
Price	3A E2 01 00 00 00 00 00	12.345

4.2 BATS to Member

4.2.1 Order Acknowledgement

Order Acknowledgement messages are sent in response to a New Order message. The message corresponds to a FIX Execution Report with *ExecType* (150) = 0 (New).

Per the instructions given in the Login Request, optional fields may be appended to echo back information provided in the original New Order message. Fields which have been requested to be echoed back, but which were not filled in will still be sent and will be filled with binary zero (0x00).

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x0A
MatchingUnit	5	1	Binary	The matching unit which created this message. Matching units in BOE correspond to matching units on Multicast PITCH.
SequenceNumber	6	4	Binary	The sequence number for this message. Distinct per matching unit.
TransactionTime	10	8	DateTime	The time the event occurred in the BATS matching engine (not the time the message was sent).
ClOrdID	18	20	Text	Echoed back from the original New Order message.
OrderID	38	8	Binary	Corresponds to <i>OrderID</i> (37) in BATS FIX. Order identifier supplied by BATS. This identifier corresponds to the identifiers used in BATS market data products.

4.2.3 Order Modified

Order Modified messages are sent in response to a Modify Order request to indicate that the order has been successfully modified.

Note: It is highly advised that all Members opt-in to receiving *LeavesQty* on Order Modified messages. In certain cases, the last message to be received on an order's lifecycle will be an Order Modified message. In such cases, to know the order is no longer live you must inspect *LeavesQty*. An example of this behavior would be modification of an order whilst an execution is being generated, resulting in the order being reduced to zero outstanding shares.

To maintain compatibility with Members who have already implemented BOE, this field will remain in the optional block.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x0C
MatchingUnit	5	1	Binary	The matching unit which created this message. Matching units in BOE correspond to matching units on Multicast PITCH.

WorkingPrice	3A E2 01 00 00 00 00 00	12.345

4.2.4 Order Restated

Order Restated messages are sent to inform the Member that an order has been asynchronously modified for some reason without an explicit Modify Order request having been sent.

Some example (non-exhaustive) reasons for Order Restated messages being sent:

- A reserve (iceberg) order has been reloaded.
- An order's remaining quantity was decremented because of a prevented wash trade.
- A recycle order has returned to rest on the book after matching liquidity on another market.
- Resting order transitions from a liquidity adder to a liquidity remover or a routed order returns to the book. This can occur as a result of discretion, when a peg order moves into another order, or an orde returns from its initial route attempt.

Members should be prepared to accept and apply Order Restated messages for any reason.

The *OrderRestatedBitfield1* and *OrderRestatedBitfield2* fields indicate the characteristics of the order which have changed. Optional fields will be present at the end of the message with the new values.

Note: It is highly advised that all Members opt-in to receiving *LeavesQty* on Order Restated messages. In some cases, the last message to be received on an order's lifecycle will be an Order Restated message. In such cases, to know the order is no longer live you must inspect *LeavesQty*. An example of this behavior would be restatement of an order in certain cases due to *PreventMemberMatch* being set to 'd'.

To maintain compatibility with Members who have already implemented BOE, this field will remain in the optional block.

Offset	Length	Data Type	Description
0	2	Binary	Must be 0xBA 0xBA.
2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
4	1	Binary	0x0D
5	1	Binary	The matching unit which created this message. Matching units in BOE correspond to matching units on Multicast PITCH.
6	4	Binary	The sequence number for this message. Distinct per matching unit.
10	8	DateTime	The time the event occurred in the BATS matching engine (not the time the message was sent).
18	20	Text	Client order ID. For user modifies, this is the <i>ClOrdID</i> from the Modify Order message. For unsolicited modifications, the <i>ClOrdID</i> is the identifier from the open order.
38	8	Binary	Corresponds to <i>OrderID</i> (37) in BATS FIX. The unique OrderID. For informational purposes only. Modifications do <i>not</i> change the OrderID.
46	1	Alphanumeric	The reason for this Order Restated message. R = Reroute W = Wash L = Reload Q = Liquidity Updated BATS reserves the right to add new values as necessary without prior notice.

4.2.5 User Modify Rejected

User Modify Rejected messages are sent in response to a Modify Order for an order which cannot be modified. User Modify Rejected messages are unsequenced.

This message corresponds to a FIX Execution Report with *MsgType* (35) = 9 (Order Cancel Reject) and *CxIRejResponseTo* (434) = 2 (Order Cancel/Replace Request).

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x0E
MatchingUnit	5	1	Binary	Unsequenced application message. Matching unit will be set to 0.
SequenceNumber	6	4	Binary	Unsequenced application message. Sequence number will be set to 0.
TransactionTime	10	8	DateTime	The time the event occurred in the BATS matching engine (not the time the message was sent).
ClOrdID	18	20	Text	The <i>ClOrdID</i> of the modify request which was rejected.

ModifyReject	38	1	Text	Reason for a modify rejection.		
Reason						
				A = Admin		
				D = Duplicate <i>ClOrdID</i>		
				H = Halted		
				I = Incorrect Data Center		
				K = Order Rate Threshold Exceeded		
				L = Order would lock or cross NBBO		
				M = MaxSize Exceeded		
				N = Ran Out of Liquidity to Execute Against		
				O = ClOrdID Doesn't Match a Known Order		
				P = Can't Modify an Order That is Pending Fill		
				R = Routing Unavailable		
				V = Would Wash		
				W = Add Liquidity Only Order Would Remove		
				X = Order Expired		
				Y = Symbol Not Supported		
				Z = Unforeseen Reason		
				m = Market Access Risk Limit Exceeded		
				r = Reserve Reload		
				x = Crossed Market		
				y = Modify received by BATS during replay

4.2.9 Trade Cancel or Correct

Used to relay a trade which has been cancelled (busted) or corrected (price change only). The *CorrectedPrice* field will be set to 0 for cancelled trades and to the new trade price for corrected trades. Trade Cancel or Correct can be sent for same day as well as previous day trades.

Field	Offset	Length	Data Type	Description
StartOfMessage	0	2	Binary	Must be 0xBA 0xBA.
MessageLength	2	2	Binary	Number of bytes for the message, including this field but not including the two bytes for the <i>StartOfMessage</i> field.
MessageType	4	1	Binary	0x12
MatchingUnit	5	1	Binary	The matching unit which created this message. Matching units in BOE correspond to matching units on Multicast PITCH.
SequenceNumber	6	4	Binary	The sequence number for this message. Distinct per matching unit.
TransactionTime	10	8	DateTime	The time the event occurred in the BATS matching engine (not the time the message was sent).
ClOrdID	18	20	Text	<i>ClOrdID</i> of the order whose fill is being cancelled or corrected.
OrderID	38	8	Binary	Corresponds to <i>OrderID</i> (37) in BATS FIX. Order whose fill is being cancelled or corrected.
ExecRefID	46	8	Binary	Corresponds to <i>ExecRefID</i> (19) in BATS FIX. Refers to the ExecID of the fill being cancelled or corrected.
Side	54	1	Alphanumeric	Side of the order.
BaseLiquidity Indicator	55	1	Alphanumeric	Indicates whether the trade added or removed liquidity, or was routed to another market. A = Added Liquidity R = Removed Liquidity X = Routed to Another Market C = BZX Auction Trade
ClearingFirm	56	4	Alpha	
ClearingAccount	60	4	Text	Echoed from original order.
LastShares	64	4	Binary	Number of shares of the trade being cancelled.
LastPx	68	8	Binary Price	Price of the trade being cancelled.
CorrectedPrice	76	8	Binary Price	For trade corrections, this is the new trade price. For trade breaks, this is set to 0.
OrigTime	84	8	DateTime	Corresponds to <i>OrigTime</i> (42). The date and time of the original trade, in GMT.

Trade Cancel or Correct Bitfields	92	7	Binary		Bitfields indicating message fields to follow. See the List of Return Bitfields section.

5 Implementation Notes

5.1 Automatic Cancel on Disconnect Malfunction

All open orders for a Member will be cancelled automatically if no messages have been received from the Member for 5 seconds. This is done to prevent orders from being stuck in an unknown state in the event of telecommunications failure. Order Cancelled messages for the automatically cancelled orders are available upon reconnection. Members are responsible for rerouting orders to other market centers based on their business needs. This should be rare, but all open orders may also be cancelled in the event of a complete or partial system malfunction.

5.2 Access Fees Returned on Order Executions

The access fee associated with each fill is calculated to 5 decimals and returned on each order execution. Negative numbers indicate liquidity rebates. Members should program their systems to read, validate, and pass along this field in order to avoid making software changes to their systems when the BATS fee schedule changes. The sum of the access fees received during a month should equal the access fee charged or rebated on a Member's monthly bill, rounded to the nearest penny.

5.3 Service Bureau Configuration

ClearingFirm must be set on New Order, Cancel Order and Modify Order messages sent to BATS. Orders with an unknown ClearingFirm will be rejected. ClOrdID values are required to be unique only within a given ClearingFirm. Messages sent by BATS will echo back the ClearingFirm value. Orders must be cancelled or modified using the same ClearingFirm as was sent on the Order.

5.4 OATS Connection ID

The OATS technical spec as of 5/3/2011 for implementation on 10/3/2011 allows for an optional 'connectionId' field to be included in your OATS feeds for the purposes of improving your order ID uniqueness. When creating OATS rows related to your transmissions to BATS, BATS recommends populating the OATS 'connectionId' field with the *SessionSubId* field as it appears on the login request. Please note that this field is optional on your OATS rows, and BATS is not recommending a perspective that you do or do not populate the field. Also note that the while not enforced internally, the BATS spec does require that your client order ID be day-unique; BATS continues to recommend this as the best way to meet OATS' day-unique order ID requirements.

6 Drop Copies

Drop copies of BOE traffic are available. Execution only drop copies are available via legacy (fixed-width) drop and FIX drop based interfaces. Order-by-order drop copies are available via Order by Order FIX drop based interfaces.

6.1 Max Number of Hits

BATS has repurposed FIX Tag 1 on FIX Drop ports to allow Registered Market Makers utilizing the BATS Market Maker Quoter to actively monitor the number of hits the Market Maker has remaining before BATS will pull both sides of their automated quote. FIX Tag 1 on FIX Drop ports will be used to maintain a count of hits remaining for a given security for all Market Maker Quoter events.

In event of an execution, FIX Tag 1 should be monitored for a value of 0 as at that point the Market Makers quote will be pulled and the Market Maker will need to take appropriate action in order to continue to fulfill their quote obligations. This may involve contacting the BATS Trade Desk to re-establish their automated quote or the Market Maker may choose to start fulfilling their quote obligation on their own.

In the case where the **Max Quote** (refer to the <u>BATS US Equities Market Maker Quoter</u> <u>Specification</u>) parameter has not been defined for a registered security, a value of UNLIMITED will be displayed in FIX Tag 1.

7 Future Expansion

New message types may be added without notice.

New fields may be added without notice. For messages which specify optional fields with bitfields (e.g., Order Acknowledgement), expansion will use a bit which has been reserved for future expansion. For messages which do not use optional fields with bitfields (e.g., Order Cancelled), fields will be appended to the end of the message.

In BATS' certification environment, undocumented messages will intentionally be sent occasionally. Undocumented extra fields will also occasionally be sent. This will aid Members in ensuring that their decoders will cope with future protocol changes.

8 List of Return Bitfields

This section lists all return bitfields. Specified unused bits *must* be set to 0, as they are reserved for future expansion. Reserved bits not noted as being required to be set to 0 are used by another BATS trading platform and will be ignored. BATS reserves the right to add more bit fields as per new requirements.

9 List of Optional Fields

This section lists all optional field types supported by all BATS trading platforms worldwide.

	Length		
Field	Len	Data Type	Description
Account	16	Text	Corresponds to <i>Account</i> (1) in BATS FIX.
			•
			Reflected back on execution reports associated with this order. Available via Standard FIX
			Drop on an opt-in basis at the port level.
			Available by default on Order by Order FIX
			Drop (Market Maker Quoter users should refer
			to the Max Number of Hits section). Not available via DROP.
AttributedQuote	1	Alphanumeric	Optional, allow for order to be attributed to
			firm's MPID in BATS market data feeds. The
			order may also be included within attributed
			summary information displays related to
			quote/trade information on the BATS web site.
			Must opt-in to support through BATS Trade
			Desk.
			N = Do not attribute firm MPID to this order.
			Y = Attribute firm MPID to this order.
BaseLiquidity	1	Alphanumeric	Indicates whether the trade added or removed
Indicator			liquidity, or was routed to another market.
			A = Added Liquidity
			R = Removed Liquidity
			X = Routed to Another Market C = BZX Auction Trade
CancelOrig	1	Alpha	Corresponds to CancelOrigOnReject (9619) in
OnReject		•	BATS FIX.
			Indicates handling of original order on failure to
			modify.
			N = Leave original order alone.Y = Cancel original order if modification fails.
Capacity	1	Alpha	Corresponds to <i>OrderCapacity</i> (47) in BATS
		•	FIX.
			A = Agency
			P = Principal
			R = Riskless

4	Text	Corresponds to OnBehalfOfSubID (116) and
		ClearingAccount (440) in BATS FIX.
		Supplemental identifier. Recorded and made available in execution reports. Available via Drop.
4	Alpha	Corresponds to OnBehalfOfCompID (115) and ClearingFirm (439) in BATS FIX.
		Firm that will clear trade. Must be allowed NSCC MPID.
2	Binary	Corresponds to <i>DiscretionAmount</i> (9622) in BATS FIX.
		• Discretion is expressed in cents (i.e. 10 is \$0.10)
		Discretion is implicitly added to bid prices and subtracted from offer prices.
		Order will be displayed at <i>Price</i> but can execute in the discretionary range.
		A discretionary order will use the minimum of discretion amount to achieve execution.
		The default is to apply no discretion.
		• Max discretion to apply to <i>Price</i> (positive value in the range of 0-99.99).
		DiscretionAmount does not mix with IOC, Post-Only.
	4	4 Alpha

DisplayIndicator	1	Alphanumeric	Corresponds to <i>DisplayIndicator</i> (9479) in BATS FIX.
			V = Default. As determined by port level setting (default to S) S = Display-Price Sliding (this is to override a opt-out of Display-Price Sliding at the port level) L = Display-Price Sliding, but reject if order crosses NBBO on entry M = Multiple Display-Price Sliding R = Reject the order if it cannot be booked and displayed without adjustment I = Invisible (implied on all Peg orders other than Market Maker Pegs) N = NoRescrapeAtLimit
			Display-Price Sliding: If the limit price of the unexecuted remainder of a day order does not lock or cross the NBBO then BATS books it as is. If the limit price does lock or cross the market BATS offers Display-Price Sliding.
			Display-Price Sliding permanently adjusts the booked price on entry to the strongest price that does not cross the NBBO. It will temporarily adjust the displayed price to the strongest price that does not lock the NBBO. When the NBBO widens, the display price will be readjusted to the booked price. The display price may be temporarily weaker than the booked price.
			Multiple Display-Price Sliding does not permanently adjust the booked price on entry, but allows for Display-Price slid orders to continue to have their display and booked prices adjusted towards their original limit price based on changes to the prevailing NBBO.
			NoRescrapeAtLimit: Applicable only to Fully Routable IOC orders (RoutingInst = R and TimeInForce = 3). After walking the price down to the limit, there will be no final scrape at BATS and the cancel code will state X (Expired) rather than N (No Liquidity).
DisplayPrice	8	Binary Price	Only present when order is fully or partially booked. If order had to be temporarily displayed at a less aggressive value to avoid locking the NBBO, then displayed price will be reported here, otherwise equals working price.

ExecInst	1	Text	Corresponds to ExecInst (18) in BATS FIX.
			f = Intermarket Sweep (Directed or BATS) r = Late (For use with Auction Only orders only. Refer to the BATS US Equities Auction Process specification for more information.) u = BATS + DRT (access liquidity on the BATS book, then route to DRT Dark Liquidity Partners (DLPs), then return to BATS order book or be cancelled depending on user's instructions) v = Force DRT (to override a port-level opt-out of DRT) w = Do not DRT (default is to DRT unless overridden at port level) P = Market Peg (peg Buy to NBBO Offer, peg Sell to NBBO Bid) Q = Market Maker Peg (see below) R = Primary Peg (peg Buy to NBBO Bid, peg Sell to NBBO Offer) M = Midpoint (peg to NBBO Midpoint) m = Midpoint (peg to NBBO Midpoint, but do not match in event the NBBO locks) L = Alternative Midpoint (less aggressive of
			midpoint and 1 tick inside NBBO) ASCII NULL (0x00) = no special handling Peg Orders: Midpoint Pegged orders (M, m and L) will be forced to hidden (<i>DisplayIndicator</i> = I), regardless of what is sent in the <i>DisplayIndicator</i> field.
			Only Hidden Primary and Market Pegs (DisplayIndicator = I) will be accepted at this time. If DisplayIndicator = V, then Primary/Market Peg order will be rejected. If DisplayIndicator is not sent, DisplayIndicator = I will be implied.
			Market Maker Pegs will peg at an offset of a defined Reference Price (see <u>BATS Market Maker Specification</u>). <i>OrdType</i> = "P" and <i>RoutingInst</i> = "P" are required. If not sent, <i>DisplayIndicator</i> will use the default setting defined on the port; orders with <i>DisplayIndicator</i> = "I" will be rejected.
			Routable Orders: BATS + DRT (u) require <i>RoutingInst</i> = R in the 1st character position. Force DRT (v) requires

EmanJunt			Double Last / "D" or "D"
ExecInst			RoutingInst ≠ "B" or "P".
(cont.)			If the let all and the of D. C. I. (D. a.
			If the 1st character of <i>RoutingInst</i> = R or
			ExecInst is not specified, then Force DRT (v)
			will be implied.
ExpireTime	8	DateTime	Corresponds to <i>ExpireTime</i> (126) in FIX.
			Required for <i>TimeInForce</i> = 6 orders, specifies
			the date-time (in GMT) that the order expires.
LastPx	8	Binary Price	Corresponds to <i>LastPx</i> (31) in BATS FIX.
			Price of this fill.
LastShares	4	Binary	Corresponds to <i>LastShares</i> (32) in BATS FIX.
			Executed share quantity.
LeavesQty	4	Binary	Corresponds to <i>LeavesQty</i> (151) in BATS FIX.
		J	27(1)
			Quantity still open for further execution. Will be
			zero if order is dead.
LocateReqd	1	Alpha	Corresponds to <i>LocateReqd</i> (114) in BATS FIX.
Locatortoqu		Tipia	corresponds to Boomertequ (111) in Bills I in
			Optional, only processed for Sell Short and Sell
			Short Exempt.
			Short Exempt.
			N = client affirms ability to borrow (Default)
			Y = client does not affirm ability to borrow
			(results in a reject)
			(results in a reject)
			Default = N
MaxFloor	4	Binary	Corresponds to MaxFloor (111) in BATS FIX.
MaxFi00i	4	Billary	Corresponds to Maxilton (111) III BATS FIX.
			Doubles of OuderOte to display The belones is
			Portion of <i>OrderQty</i> to display. The balance is
			reserve. 0 displays the entire quantity. The
			displayed quantity of each order at a price level
			is decremented first. When displayed quantity is
			fully decremented, it is reloaded up to MaxFloor
			from reserve.
			Default = 0
MaxRemovePct	1	Binary	Corresponds to MaxRemovePct (9618) in BATS
			FIX.
			For Post Only At Limit ($RoutingInst = Q$), what
			percentage of the order quantity which remains
			after price improvement may be removed at the
			limit.
			Must be 0 for non-Post Only At Limit orders.

MinQty	4	Binary	Corresponds to MinQty (110) in BATS FIX.
			Optional minimum fill quantity for BATS Only hidden or IOC orders. When removing liquidity, limits the minimum total fill size, which may be made up of several consecutive smaller fills.
			Ignored if order is not BATS Only hidden or IOC.
			Set to 0 to allow fills of any size.
			Default = 0
OrderQty	4	Binary	Corresponds to OrderQty (38) in BATS FIX.
			Number of shares for the order. System-wide limit is 999,999 shares.
OrdType	1	Alphanumeric	Corresponds to <i>OrdType</i> (40) in BATS FIX.
			1. 36.1
			1 = Market
			2 = Limit
			P = Pegged
			Pegged requires ExecInst be set to L, M, P, Q, or R.
			Default = 2
OrigClOrdID	20	Text	Corresponds to <i>OrigClOrdID</i> (41) in BATS FIX.
PegDifference	8	Signed Binary Price	Corresponds to <i>PegDifference</i> (211) in BATS FIX.
			Optional signed value up to four decimal places is added to the result of peg calculation. <i>PegDifference</i> is round (down for buy, up for sell) to fit the tick size.
			Must be ≥ 0 for sell orders. Must be ≤ 0 for buy orders. Must be zero for midpoint peg or non-pegged orders.

Duarrant M1	2	A 1 mln o	Company do to D
PreventMember	3	Alpha	Corresponds to <i>PreventMemberMatch</i> (7928) in
Match			BATS FIX.
			Three characters:
			1 st character – MTP Modifier:
			N = Cancel Newest
			O = Cancel Oldest
			B = Cancel Both
			D = Decrement Larger/Cancel Smaller
			d = Same as D above, but only
			decrement LeavesQty. Do not
			restate <i>OrderQty</i> .
			2 nd character - Unique ID Level:
			F = Prevent Match at BZX Exchange
			Member Level
			M = Prevent Match at MPID Level
			3rd character - Trading Group ID (optional):
			Member specified alphanumeric value
			0-9, A-Z, or a-z.
			,
			The Unique ID Level (character 2) of both
			orders must match to prevent a trade. If
			specified on both orders, Trading Group ID
			(character 3) must match to prevent a trade.
			(character 3) must match to prevent a trade.
			The MTP Modifier (character 1) of the inbound
			order will be honored, except that if the inbound
			order specifies Decrement and the resting order
			does not, and the resting order is larger, then
			both orders will be cancelled. This exception is
			to protect the order-entry software for the resting
			order from receiving an unexpected restatement
			message. If order-entry software is prepared to
			handle unexpected restatement messages, this
			exception may be overridden at the port level by
			requesting "Allow MTP Decrement Override"
			functionality.
			ranctionanty.
			Users of MTP Modifier D or d AND users of
			"Allow MTP Decrement Override" functionality
			must be prepared to receive an Order
			Restated message that decrements <i>LeavesQty</i>
			(and also <i>OrdQty</i> for method D).
Price	8	Binary Price	Corresponds to <i>Price</i> (44) in BATS FIX.
			•
			Limit price. Four implied decimal places.

RoutingInst	4	Text	1 st character: Specifies the target destination.
			A = NYSE ARCA B = BATS BZX Exchange Only C = NSX D = EDGA G = EDGX J = BATS BYX Exchange - B2B K = Nasdaq BX L = LavaFlow M = Chicago N = NASDAQ P = BATS BZX Exchange Only Post Only (will reject rather than remove visible liquidity unless the value of price improvement associated with the execution equals or exceeds the sum of fees charged for the execution plus the value of the rebate that would have been provided if the order posted to the BATS book and provided liquidity) Q = BATS BZX Exchange Only Post Only At Limit (remove shares that improve upon limit
			price and up to MaxRemovePct of remaining OrdQty at limit price) R = Smart route to visible markets (default) U = NYSE MKT
			W = CBSX X = Nasdaq PSX Y = NYSE
			 Post Only does not mix with <i>TimeInForce</i> = 3. BATS Only Post Only orders do not interact with hidden order on entry <i>unless the value of price improvement associated with the execution equals or exceeds the sum of fees charged for the execution plus the value of the rebate that would have been provided if the order posted to the BATS book and provided liquidity.</i> BATS Only Post Only At Limit orders do not interact with hidden orders on entry at the stated limit price.
			2 nd character: Only applicable when 1 st is R, is used to enable/disable Re-Route on Lock/Cross:
			L = Re-Route. Allow for use of CYCLE or Parallel strategy up to limit or discretion

RoutingInst	price on entry and allow for re-route via
(Cont.)	CYCLE or Parallel strategy after the order
(Cont.)	has booked only if another market locks or
	crosses the limit or discretion price.
	N = Do not Re-Route.
	3 rd character: Only applicable if 1st is R,
	specifies the routing strategy:
	C = CYCLE
	D = Parallel-D (default)
	R = TRIM
	r = TRIM- (do not scrape BZX book first*)
	P = TRIM2 TRIM2 (do not serone PZV hook first*)
	p = TRIM2- (do not scrape BZX book first*) Q = TRIM3
	q = TRIM3- (do not scrape BZX book first*)
	$Q = 1 \text{ KIMS}^2$ (do not scrape BZA book first) $S = \text{SLIM}$
	s = SLIM+ (route to BYX Exchange prior to
	scraping BZX Exchange book*)
	T = Parallel-T
	2 = Parallel-2D
	* Unless Price Improvement is available.
	4 th character: Reserved for future use.
	In order to specify values for the 2nd and/or 3rd
	character, the prior character(s) MUST be
	populated with a valid value. If <i>RouteInst</i> is not
	specified, a default value of RND is implied (All
	Visible Markets/No Re-Route/Parallel-D).
	ASCII NULs (0x00) in 2 nd , 3 rd , or 4 th character
	positions will imply the default value for their
	respective position.
	As the default RouteInst value is subject to
	change with little or no notice, it is
	recommended you specify values for all 4
	character positions if you wish to maintain
	maximum control of your routing decisions.
	For more information regarding the various
	routing strategies available on BATS, refer to
	http://www.batstrading.com/features/.

SecondaryOrderID	8	Binary	Corresponds to SecondaryOrderID (198) in BATS FIX.
			Denotes an alternative <i>OrderID</i> which is present on BATS market data feeds (for example, to hide that a reserve (ice-berg) order has reloaded or increased in size). Or, <i>OrderID</i> of the contra side of a prevented match.
Side	1	Alphanumeric	Corresponds to <i>Side</i> (54) in BATS FIX. 1 = Buy 2 = Sell 5 = Sell Short (client affirms ability to borrow) 6 = Sell Short Exempt
Symbol	8	Alphanumeric	Corresponds to <i>Symbol</i> (55) in BATS FIX. Uniform symbology identifier for the instrument.
SymbolSfx	8	Alphanumeric	Corresponds to <i>SymbolSfx</i> (65) in BATS FIX. CQS or CMS suffix, if used. Do not send <i>SymbolSfx</i> if using BATS format or if symbol does not have a suffix.
TimeInForce	1	Alphanumeric	Corresponds to TimeInForce (59) in FIX. 0 = Day 1 = GTC (allowed, but treated as Day) 2 = At the Open 3 = IOC (Portion not filled immediately is cancelled. Market orders are implicitly IOC.) 5 = GTX (Expires at end of extended day) 6 = GTD (expires at earlier of specified ExpireTime or end of extended day) 7 = At the Close R = RHO (Regular Hours Only – Applicable to BATS Listed Securities Only)
WorkingPrice	8	Binary Price	Only present when order is fully or partially booked. If price had to be adjusted to a less aggressive value to avoid crossing the NBBO, the adjusted price will be reported here, otherwise equals price.

10 List of Message Types

10.1 Member to BATS

Message Name	Session/Application	Message Type	Sequenced
Login Request	Session	0x01	No
Logout Request	Session	0x02	No
Client Heartbeat	Session	0x03	No
New Order	Application	0x04	Yes
Cancel Order	Application	0x05	Yes
Modify Order	Application	0x06	Yes

10.2 BATS to Member

Message Name	Session/Application	Message Type	Sequenced
Login Response	Session	0x07	No
Logout	Session	0x08	No
Server Heartbeat	Session	0x09	No
Replay Complete	Session	0x13	No
Order Acknowledgement	Application	0x0A	Yes
Order Rejected	Application	0x0B	No
Order Modified	Application	0x0C	Yes
Order Restated	Application	0x0D	Yes
User Modify Rejected	Application	0x0E	No
Order Cancelled	Application	0x0F	Yes
Cancel Rejected	Application	0x10	No
Order Execution	Application	0x11	Yes
Trade Cancel or Correct	Application	0x12	Yes

11 Port Attributes

The table below lists BOE port attributes that are configurable on the port or firm level. Changes to these attributes can be made by sending a written request to tradedesk@batstrading.com.

Attribute	Default	Description
Allowed Clearing MPID(s)*	All MPIDs	Clearing MPID(s) allowed for trading on port.
Default Clearing MPID	None	Default MPID to use if none is sent on New Order.
Allow Pre-market*	Yes	Allows for orders to be entered prior to regular market open.
Allow Post-market*	Yes	Allows for orders to be entered after the regular market close.
Allow Short Sales*	Yes	Allows or disallows short sales.
Allow ISO*	Yes	Allows or disallows ISO orders.
Allow Directed ISO*	Yes	Allows or disallows ISO orders directed to other market centers.
Default Routing Instruction†	"RND"	Specifies a default value for RoutingInst.
Default Exec. Instruction†	None	Specifies a default value for <i>ExecInst</i> .
Maximum Order Size*	25,000	Maximum number of shares allowed per order.
Maximum Order Dollar Value*	Unlimited	Maximum order dollar value per order.
Default Price Sliding†	"S"	Default price sliding behavior. Specifies a default value for <i>DisplayIndicator</i> .
Default Pricing Sliding (Hidden Order Override)†	"S"	When a different default price sliding behavior is desired for hidden orders, this port attribute may be used. Specifies a default value for <i>DisplayIndicator</i> , but only for hidden orders.

Cancel on Disconnect	Option #1	BATS will offer Members 3 options for cancelling orders as a result of a session disconnect: 1. Cancel Continuous Book Orders Only (default) 2. Cancel All Open Orders (continuous books and On-Open, On-Close and Late orders)* 3. Do Not Cancel Any Open Orders *If disconnect occurs during the cut-off period for an auction, On-Open, On-Close and Late orders that are to participate in the auction will not be cancelled.
Send Trade Breaks^	No	Enables Trade Cancel or Correct messages.
Default MTP Value*^†	None	Specifies Default value for <i>PreventMemberMatch</i> .
Allow MTP Decrement Override*^	No	Overrides the exception that requires both the resting and inbound order to be marked as "Decrement".
Allow Sponsored Participant MTP Control*^	No	Allows Sponsored Participant to override port default for MTP by using <i>PreventMemberMatch</i> on order-level.
Cancel on Reject†	No	Cancels an order upon a cancel or modify reject for that order.
Opt-out of PITCH Obfuscation	No	Opt-out all orders from PITCH Order Id obfuscation for hidden and reserve orders.
Decrement Remainder Only^	No	Enables "d" option for MTP. See <i>PreventMemberMatch</i> for details.
Fat Finger Protection*	None	Specifies a percentage based limit price tolerance where any orders entered with a limit price that is through the NBBO by an amount greater than or equal to the defined percentage will be rejected.
Reject Orders on DROP Port Disconnect*	No	Allows Member/Sponsoring Firms to associate a DROP port(s) to an order entry port(s). Once the association has been established and all DROP ports associated with a order entry port experience a session disconnect, reject orders on the order entry port until at least one of the DROP port sessions have been reestablished.

Reject Orders on DROP Port Timeout(s)*	30 sec	Only applicable for sessions where "Reject Orders on DROP Port Disconnect" has been enabled. When the last associated DROP port for the order entry session has disconnected, the reject/cancel actions will be taken on the order entry session if an associated DROP port has not reestablished its connection in the defined time. Minimum value allowed is 20.
Cancel Open Orders on DROP Port Disconnect*	No	Only applicable for sessions where "Reject Orders on DROP Port Disconnect" has been enabled. If all DROP ports associated with an order entry port become disconnected, cancel all open orders on the order entry port.
Notional Cutoff Aggregation Methods		Gross exposure = CBB + CBO + CEB + CEO. Net exposure = ABSOLUTE VALUE of [(CEO + CBO) – (CEB+CBB)] On a given port BATS will calculate and track four values as follows: Cumulative Notional Booked Bid Value (CBB) – The sum of limit price * size for all buy limit orders on the book. Cumulative Notional Booked Offer Value (CBO) – The sum of limit price * size for all sell limit orders on the book. Cumulative Notional Executed Bid Value (CEB) – The sum of size * trade price on all executed buy orders. Cumulative Notional Executed Offer Value (CEO) – The sum of size * trade price on all executed sell orders.
Gross Daily Risk Limit Order Notional Cutoff*	None	Optional parameter that if specified will result in rejects for limit orders when gross exposure of limit orders exceeds this value. Whole dollar value not to exceed \$1B/port.
Gross Daily Risk Market Order Notional Cutoff*	None	Optional parameter that if specified will result in rejects for market orders when gross exposure of limit orders exceeds this value. Whole dollar value not to exceed \$1B/port.

Net Daily Risk Limit Order	None	Optional parameter that if specified will result in rejects
Notional Cutoff*		for limit orders when net exposure of limit orders
		exceeds this value. Whole dollar value not to exceed
		\$1B/port.
Net Daily Risk Market Order	None	Optional parameter that if specified will result in rejects
Notional Cutoff*		for market orders when net exposure of limit orders
		exceeds this value. Whole dollar value not to exceed
		\$1B/port.
Default Attributed Quote*†	Never	Specifies a default value for AttributedQuote. May only
		override at order to level after executing Attribution
		Addendum to Exchange User Agreement. Once
		Addendum has been executed, may default to Yes or No
		through BATS Trade Desk.
Crossed Market Reject/Cancel	No	Reject new orders upon receipt when the NBBO in the
		subject security is crossed. Routable orders will have
		any remaining quantity cancelled back if the NBBO is
		crossed when the order returns to the BATS Book. Order
		modifications which cause a loss of priority (e.g. due to a
		price change or increase in size) will result in a cancel of
		the original order if the NBBO is crossed upon receipt of
		the modify instruction.

^{*} Sponsored Participants require written approval from Sponsors to update these settings on ports associated to a Sponsor's MPID.

12 Support

Please email questions or comments regarding this specification to tradedesk@batstrading.com.

[†] Port attribute can be overridden via BOE on an order by order basis.

[^] Requires certification.

Revision History

Document	Date	Description	
Version			
1.0.0	07/07/11	Initial Version 1.0.0.	
1.0.1	07/12/11	Added clarification to Optional Fields and Bitfields section.	
1.0.2	07/15/11	Typo corrected for LoginResponseStatus message length.	
1.1.0	07/21/11	Removed various references to flags used in other BATS markets.	
		DiscretionAmount size changed from 8 to 2.	
1.1.1	08/02/11	Removed Clearing Account from Cancel Order and Modify	
		Order input messages. It does not make sense to send this field	
		on those message types.	
		Added definition for OrigClOrdID, LastShares, LastPx, and	
		SecondaryOrderID to List of Optional Fields section.	
		LocateReqd is valid bitfield of NewOrderBitfield3.	
1.1.2	08/05/11	Removed LockedQty references (BATS EU specific).	
1.1.3	08/12/11	Added Symbol to ReturnBitfield2 of Order Restated and	
		Order Cancelled messages.	
		Added Side to ReturnBitfield1 of Order Cancelled messages.	
		Add Port Attributes section.	
		Added LoginResponseStatus Reason Code 'M = Invalid Login	
		Request message structure'.
